

4G GSM Commercial Fire Radio Communicator

Honeywell

**When it comes to fire alarm communications, failure is not an option.
Upgrade to 4G radios now.**

4G Alarm Communications

At Honeywell, we know that failure isn't an option—especially when it comes to security system signals getting through to central stations in the event of a burglary, fire or any situation where life safety is involved. Here's why upgrading your system to include a 4G GSM commercial fire radio communicator is absolutely vital:

- 4G—the same lightning-fast wireless technology millions use on their mobile phones—is the most reliable method of security system alarm signal transport there is
- No landline required!
- Major network carriers, including AT&T®—are prioritizing 4G over slower alternatives including 2G, which is the current communication your security system uses
- Meets stringent supervision rates of your local AHJ
- 4G maintains a continuous, uninterrupted link with your central station so your security system can function properly 24 hours a day, seven days a week
- With 4G, your connection remains secure whether you have a power outage, damaged phone line or are a mobile phone-only business
